

**Recovering
a Saskatchewan treasure**

The discovery
In 1985, a Saskatchewan farmer discovered a fossilized dinosaur skull in his field. The skull was found in a layer of sandstone that is known to contain fossils of dinosaurs.

The find
The skull was found in a layer of sandstone that is known to contain fossils of dinosaurs. The skull was found in a layer of sandstone that is known to contain fossils of dinosaurs.

Preparing the bones
The bones were prepared by removing the surrounding rock. This was done by using a variety of tools, including chisels and hammers.

Reconstruction
The skull was reconstructed by using a variety of techniques, including plaster and resin. The skull was reconstructed by using a variety of techniques, including plaster and resin.

RAILWAY GALLERY

The exhibit is a large, curved display table with a blue top and a perforated metal base. The table is illuminated with blue and green lights. On the table, there are several informational panels. The main panel is blue and features the text "The Royal Saskatchewan Museum" and "1770 Hunter of the prairie sea". It also includes a diagram of a dinosaur and the year "1995". To the left, there is a circular panel with a globe and the year "1691". To the right, there is a red circular panel with a globe and the year "1770". The dinosaur skeleton is mounted on the table, and its long neck is extended upwards. The background is dark, and there are spotlights on the ceiling.
